Preventive skin protection (3-point program) required

Protective gloves

The glove material has to be impermeable and resistant to the product/ the substance/ the preparation.

Due to missing tests no recommendation to the glove material can be given for the product/ the preparation/ the chemical mixture.

Selection of the glove material on consideration of the penetration times, rates of diffusion and the degradation

· **Material of gloves**

The selection of the suitable gloves does not only depend on the material, but also on further marks of quality and varies from manufacturer to manufacturer. As the product is a preparation of several substances, the resistance of the glove material can not be calculated in advance and

## SECTION 10: Stability and reactivity

## · 10.1 Reactivity

Diisocyanates react with many materials where the reaction rate with the temperature and with increasing contact increases and the reactions can be severe.

Contact is increased by stirring or by mixing of another substance with Diisocyanate. Diisocyanates are not soluble in water, sink to the bottom but react slowly at the Interface. The reaction forms carbon dioxide gas and a layer of solid polyurea. In the reaction with water to form carbon dioxide and heat.

## · 10.2 Chemical stability

## · Thermal decomposition / conditions to be avoided:

No decomposition if used according to specifications.

## · 10.3 Possibility of hazardous reactions

Exothermic reaction with amines and alcohols; reacts with water forming CO<sub>2</sub>, in closed containers risk of bursting owing to increase of pressure.
